

After Vaccination Information

Vaccines, like any other medication or natural therapy, can have side effects. This leaflet explains the reactions that may occur after receiving a vaccine and what to do if they occur.

Common reactions

Most vaccines can cause mild reactions; these are usually short lasting and do not require special treatment (see over page). If the reaction seems severe or persists and/or you are concerned, seek further advice from your GP or immunisation provider as soon as possible or go directly to a hospital. Alternatively you can call the Immunisation Section at SA Health on 1300 232 272 during business hours. Outside these hours call *healthdirect Australia* on 1800 022 222.

Rare reactions

On very rare occasions a severe allergic reaction such as anaphylaxis may occur, requiring immediate medical treatment. Your immunisation provider is trained to recognise and manage any immediate severe reactions. If a severe allergic reaction is going to occur, it will generally be within the first 15 minutes of receiving a vaccine.

It is important for you to wait for 15 minutes after receiving a vaccine so you may be observed for any reactions, and for treatment to be provided if needed.

Also, you should not drive for 30 minutes after receiving a vaccine.

How to report a reaction

Reporting a reaction following immunisation is an essential part of ensuring ongoing vaccine safety monitoring.

All serious or unexpected reactions should be reported either by completing an online Vaccine Reaction Report Form at www.sahealth.sa.gov.au/immunisation or by contacting the Immunisation Section on 1300 232 272 during business hours. Alternatively you can report the reaction to your immunisation provider.

All vaccines used in Australia have been extensively tested for safety

Before any vaccine can be used in Australia it must be licensed by the Therapeutic Goods Administration (TGA). The TGA uses scientific evidence on each vaccine to assess safety and effectiveness.

Further information

If you would like further information please go to 'Immunisation Myths and Realities' at https://beta.health.gov.au/topics/immunisation or the National Centre for Immunisation Research and Surveillance (NCIRS) at www.ncirs.edu.au

Most vaccines can cause the following common reactions:

Common reactions	Management of common reactions				
Any injection can cause soreness, redness, itching, swelling or burning at the injection site for 1-2 days	 Paracetamol may be given as per instructions on the bottle/packet, to ease injection site discomfort, a cool cloth placed onto the injection site may also help. 				
A fever (temperature)	Paracetamol may also be given as per instructions on the bottle/ packet for fever (temperature) Give extra fluids and do not overdress infants if hot				
A small hard lump may appear where the injection was given and persist for some weeks or months	No treatment needed				

ruitilei common reactions specific to each vaccine are listed below.							
Diphtheria / tetanus / pertussis (whooping cough) / polio containing vaccines	Measles / mumps / rubella / varicella (chickenpox) containing vaccines						
□ DTPa – hepB – IPV – Hib □ DTPa – IPV □ dTpa □ dT □ DTPa □ DTPa	MMR MMRV Varicella						
	Common reactions as listed above						
 Common reactions as listed above Irritable, crying, unsettled and/or generally unhappy Drowsiness or tiredness Feeling unwell, muscle aches and/or joint pain Decreased appetite and/or nausea Headache (dTpa) 	 The following reactions may occur 5-12 days after MMR vaccination: Temperature (above 39°C) lasting 2-3 days, faint red rash (not infectious), cold like symptoms, feeling unwell Swollen glands, stiff neck and/or joint pain The following reaction may occur 5-26 days after varicella vaccination: Chickenpox like rash (2-5 lesions) usually at injection site, occasionally elsewhere If a chickenpox like rash develops, cover the rash and avoid contact with people who have lowered immunity until the rash heals. 						
Oral Rotavirus vaccine Vomiting and diarrhoea can occur up to 7 days after vaccination							
Pneumococcal conjugate (Prevenar 13) vaccine							
Common reactions as listed above Irritable, drowsy and/or decreased appetite							
Haemophilus influenzae type B							
Common reactions as listed above Irritable, crying, unsettled, drowsy and/or generally unhappy	Human Papillomavirus (HPV) vaccine Common reactions as listed above						
Meningococcal vaccines	Headache, tiredness and/or muscle aches Nausea						
Common reactions as listed above							
Irritability Headaches Drowsiness Rash and/or nausea	Hepatitis B (Hep B) vaccine						
Decreased appetite	Common reactions as listed above						
Paracetamol is recommended before the administration of meningococcal B vaccine for children less than 2 years.	Nausea, feeling unwell Headache, loss of appetite						
Hepatitis A (Hep A) vaccine	Pneumococcal 23-valent polysaccharide						
Common reactions as listed above	(Pneumovax23) vaccine Common reactions as listed above Muscle soreness, tiredness and/or chills						
Headache, feeling unwell and/or tiredness							
Inactivated poliomyelitis vaccine (IPV) • Common reactions as listed above							
Common reactions as listed above Muscle aches	 Influenza vaccine Common reactions as listed above Drowsiness, tiredness and/or feeling unwell Muscle aches 						
Young babies – crying and/or decreased appetite							
Zoster (herpes zoster)							
Common reactions as listed above	In children less than 5 years of age, these side effects may be more pronounced						
Fatigue Headache Chickenpox like rash around injection site							
22.2. pox inte rasir around injection site							

Fainting may occur but this is seen mainly in adolescents and adults. Anyone who complains of 'giddiness' or light-headedness before or after vaccination should be advised to lie down until free of symptoms.
